

KECE471 Computer Vision

# Filtering and Enhancing Images

*Chang-Su Kim*

Chapter 5, Computer Vision by Shapiro and Stockman

Note: Some figures and contents in the lecture notes of Dr. Stockman are used partly.

# Make it better for human or machine vision

(a) original

(b) Laplacian of (a)

(e) smoothed (a)

(f) = (c)x(e)

(c) = (a)+(b)

(d) gradient of (a)

(g) = (a)+(f)

(h) power-law transform of (g)

# Make it better for human or machine vision

a b c

**FIGURE 4.20** (a) Original image ( $1028 \times 732$  pixels). (b) Result of filtering with a GLPF with  $D_0 = 100$ . (c) Result of filtering with a GLPF with  $D_0 = 80$ . Note reduction in skin fine lines in the magnified sections of (b) and (c).

# Make it better for human or machine vision

Strong noise

Medium noise

Weak noise

# Image Enhancement and Restoration

- Enhancement
  - **Subjective improvement** of image quality to increase the detectability of important image details or objects by human or machine
- Restoration
  - **Object recovery** of original image from degraded image
  - Knowledge on the image degradation process is required

# Point Operator

- Point processing

$$g(x,y) = T[ f(x,y) ]$$

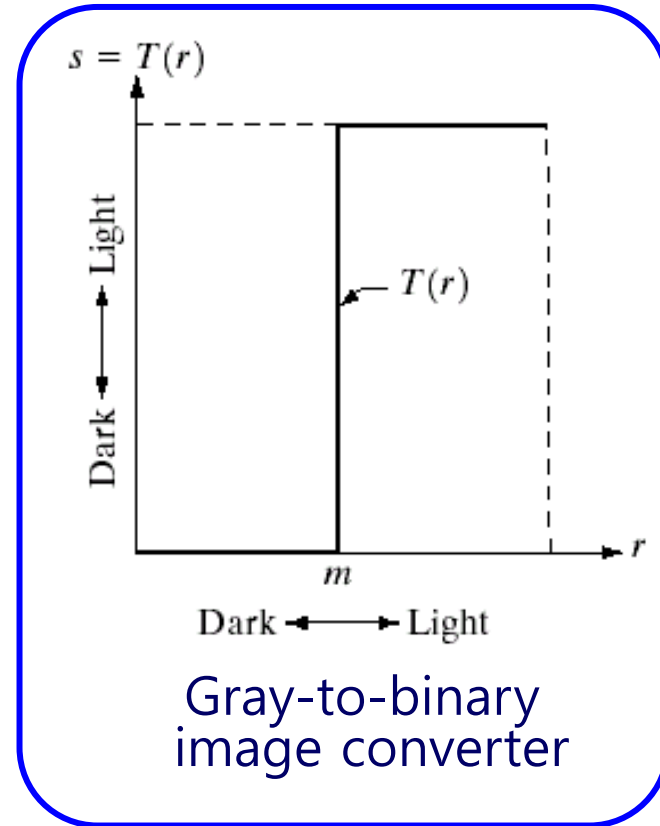

- Output pixel value depends only on the input pixel value at the same location

- The enhancement system is fully described by

$$s = T(r)$$

where  $s = g(x,y)$  and  $r = f(x,y)$

# Point Operator

# Point Operator

## – Gamma Correction

- $s = c r^\gamma$ 
  - $c = 255^{1-\gamma}$  :  
[0,255]  $\rightarrow$  [0,255]
- $\gamma < 1$ :
  - expand dark levels and compress bright levels
- $\gamma > 1$ :
  - expand bright levels and compress dark levels
- Varying  $\gamma$  controls the amount of expansion and compression

# Point Operator

## – Histogram Equalization

- Histograms are the basis for numerous spatial domain image processing techniques
  - Rough estimate of probability distribution of gray levels
  - Simple to compute

- Histogram

$$h(r_k) = n_k$$

- $r_k$ : k-th gray level
- $n_k$ : the number of pixels in the image having gray level  $r_k$

- Normalized histogram

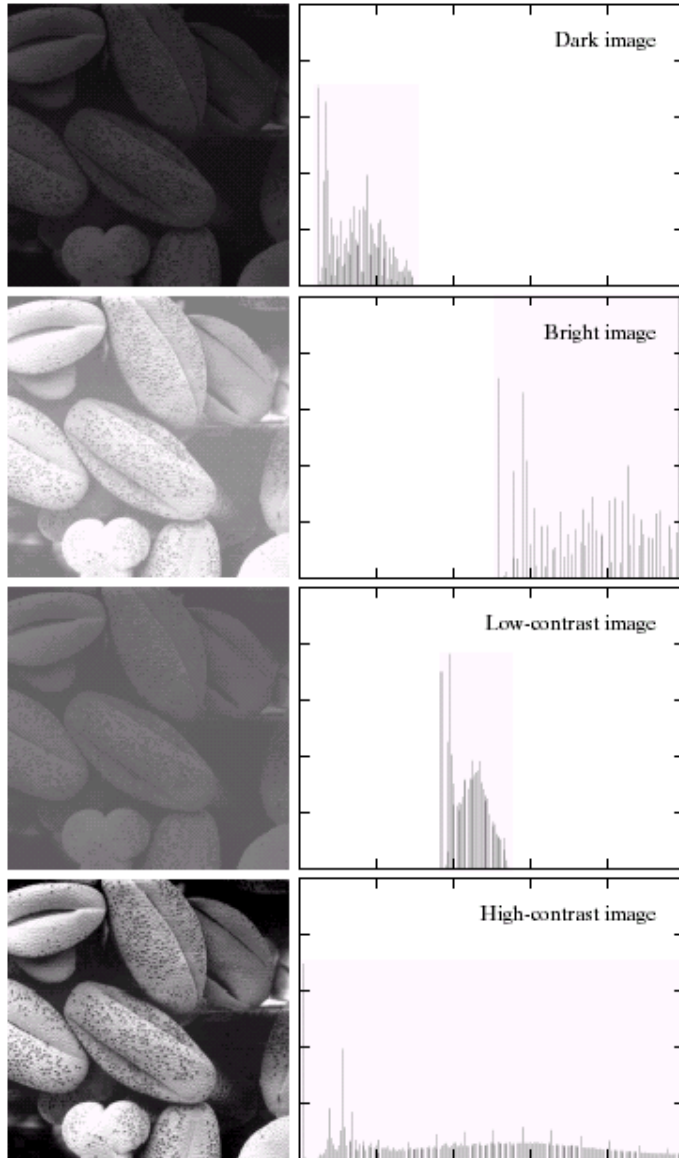

$$p(r_k) = n_k/n$$

- $n$ : the total number of pixels

- $\sum_k p(r_k) = 1$

# Point Operator

## – Histogram Equalization

- In general, the uniform distribution of gray levels is desirable
  - ▶ high contrast
  - ▶ a great deal of details
  - ▶ high dynamic range

# Point Operator

## – Histogram Equalization

- Example: An image of 128 pixels. There are 8 gray levels only.
  - Note that each gray level should have 16 pixels in the output histogram

| $r_k$      | 0 | 1 | 2  | 3  | 4  | 5   | 6   | 7   |
|------------|---|---|----|----|----|-----|-----|-----|
| $n_k$      | 1 | 7 | 21 | 35 | 35 | 21  | 7   | 1   |
| $\sum n_k$ | 1 | 8 | 29 | 64 | 99 | 120 | 127 | 128 |
| $T(r_k)$   | 0 | 0 | 1  | 3  | 6  | 7   | 7   | 7   |

- Ideally, starting from the smallest gray level,
  - the first 16 pixels should be assigned gray level 0 (0, 1 => 0)
  - 32 pixels => gray level 0 or 1 (0, 1, 2 => 0, 1)
  - 48 pixels => gray level 0, 1, or 2 Skip
  - 64 pixels => gray level 0, 1, 2, 3 (0, 1, 2, 3 => 0, 1, 2, 3)
  - 80 pixels => gray level 0, 1, 2, 3, 4 Skip
  - 96 pixels => gray level 0, 1, 2, 3, 4, 5 Skip
  - 112 pixels => gray level 0, 1, 2, 3, 4, 5, 6 (0, 1, 2, 3, 4 => 0, 1, 2, 3, 4, 5, 6)
  - 128 pixels => gray level 0, 1, 2, 3, 4, 5, 6, 7 (0, 1, 2, 3, 4, 5, 6, 7 => 0, 1, 2, 3, 4, 5, 6, 7)

# Point Operator

## – Histogram Equalization

- Example: An image of 128 pixels. There are 8 gray levels only.
  - Note that each gray level should have 16 pixels in the output histogram
  - More sophisticated equalization

| $r_k$      | 0 | 1 | 2                           | 3   | 4  | 5   | 6   | 7   |
|------------|---|---|-----------------------------|---|----|-----|-----|-----|
| $n_k$      | 1 | 7 | 21                          | 35  | 35 | 21  | 7   | 1   |
| $\sum n_k$ | 1 | 8 | 29                          | 64  | 99 | 120 | 127 | 128 |
| $T(r_k)$   | 0 | 0 | 0: 8 pixels<br>1: 13 pixels | 1: 3 pixels<br>2: 16 pixels<br>3: 16 pixels |    |     |     |     |

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 2 | 2 | 2 | 2 | 2 | 2 | 2 | 2 | → | 0 |

Fig. 3. (a) Original image, (b) output of SHE, and (c) output of SHE + POCS. (d), (e), and (f) are enlarged parts of (a), (b), and (c), respectively.

**Fig. 4.** Comparison of the proposed algorithm with the conventional histogram equalization method in [1]: (a) the original image SANTA, (b) the conventional histogram equalization method, (c) the proposed SHE + POCS algorithm, and (d) the proposed SHS + POCS algorithm. (e), (f), (g), and (h) are enlarged parts of (a), (b), (c), and (d), respectively.

# Removal of Small Image Regions

- Removal of Salt-and-Pepper Noise

Input

8-neighbor decision

4-neighbor decision

# Removal of Small Image Regions

- Removal of Small Components
  - Count the number of pixels in a component. If it is less than a threshold, remove the component.
  - ex) Threshold 12

# Masking (Linear Filtering)

- Mask is moved from pixel to pixel
- At each location, the mask coefficients are multiplied by the corresponding pixel values, and then summed up

$$g(x,y) = w(-1,-1)f(x-1,y-1) + w(-1,0)f(x-1,y) + \dots + w(1,1)f(x+1,y+1)$$

Masking with      Convolving with

|   |   |   |
|---|---|---|
| a | b | c |
| d | e | f |
| g | h | i |

=

|   |   |   |
|---|---|---|
| i | h | g |
| f | e | d |
| c | b | a |

# Masking (Linear Filtering)

- Masking with a mask  $w$  of size  $(2a + 1) \times (2b + 1)$

$$g(x, y) = \sum_{s=-a}^a \sum_{t=-b}^b w(s, t) f(x + s, y + t)$$

- Convolution with a filter  $h$  of size  $(2a + 1) \times (2b + 1)$

$$g'(x, y) = \sum_{s=-a}^a \sum_{t=-b}^b h(s, t) f(x - s, y - t)$$

- Note that  $g(x, y) = g'(x, y)$  if  $w(s, t) = h(-s, -t)$

- For masking, we use the following notation also

$$R = \sum_{i=1}^k w_i z_i = w_1 z_1 + w_2 z_2 + \dots + w_k z_k$$

where  $w_i$ 's are masking coefficients and  $z_i$ 's are pixel values.

|       |       |       |
|-------|-------|-------|
| $w_1$ | $w_2$ | $w_3$ |
| $w_4$ | $w_5$ | $w_6$ |
| $w_7$ | $w_8$ | $w_9$ |

# Masking (Linear Filtering)

- Boundary problem

- Limit the excursion of the center of the mask, so that the mask is fully contained within the image
  - Output image is smaller than input image
- Extrapolate the input image sufficiently, so that the mask can be applied near the boundaries also.
  - Zero padding
  - Repetition
  - Mirroring
  - etc

|   |   |   |   |   |
|---|---|---|---|---|
| 0 | 0 | 0 | 0 | 0 |
| 0 | 0 | 0 | 0 | 0 |
| 0 | 0 | a | b | c |
| 0 | 0 | d | e | f |
| 0 | 0 | g | h | i |

|   |   |   |   |   |
|---|---|---|---|---|
| a | a | a | b | c |
| a | a | a | b | c |
| a | a | a | b | c |
| d | d | d | e | f |
| g | g | g | h | i |

|   |   |   |   |   |
|---|---|---|---|---|
| a | a | d | e | f |
| a | a | a | b | c |
| b | a | a | b | c |
| e | d | d | e | f |
| h | g | g | h | i |

# Smoothing Filters

- Averaging filter (**box filter**) and weighted averaging filter

$$\frac{1}{9} \times \begin{array}{|c|c|c|} \hline 1 & 1 & 1 \\ \hline 1 & 1 & 1 \\ \hline 1 & 1 & 1 \\ \hline \end{array} \quad \frac{1}{16} \times \begin{array}{|c|c|c|} \hline 1 & 2 & 1 \\ \hline 2 & 4 & 2 \\ \hline 1 & 2 & 1 \\ \hline \end{array}$$

- Blends with adjacent pixel values
- Blurring
  - Removal of small details before large object extraction
  - Bridging of small gaps in lines or curves
  - Reduction of sharp transitions in gray levels
    - Advantage: noise reduction
    - Disadvantage: edge blurring

# Smoothing Filters

- Gaussian filter

$$g(x, y) = c \sum_s \sum_t w(s, t) f(x + s, y + t)$$

where

$$w(s, t) = e^{-\frac{(s^2+t^2)}{2\sigma^2}}$$

# Smoothing Filters

- Losing edges
- Reducing noises
- Removing small objects

# Smoothing Filters

- Finding objects of interest

a b c

---

# Order-Statistics Filter

- Sort the gray levels of the neighborhood
  - (0, 1, 2, 2, 3, 4, 5, 6, 6)  
min            median            max
- Min filter
  - Replace the center pixel with the minimum gray level (0)
- Max filter
  - Replace the center pixel with the maximum gray level (6)
- Median filter
  - Replace the center pixel with the median (3)
  - Excellent suppression of salt-and-pepper noises without blurring

|   |   |   |
|---|---|---|
| 6 | 4 | 6 |
| 2 | 1 | 3 |
| 2 | 5 | 0 |

3x3 averaging filter

3x3 median filter

# Deraining

## Video Deraining and Desnowing

# Edge Detection Using Difference Masks

- Finding the image points of high contrast

# Edge Detection Using Difference Masks

- Difference masks
  - cf. Sum masks for smoothing
  - Derivative in digital domain
- 1<sup>st</sup>-order derivative (1D case)

$$\frac{\partial f}{\partial x} = f(x) - f(x-1)$$

- 2<sup>nd</sup>-order derivative

$$\frac{\partial^2 f}{\partial x^2} = f(x+1) - f(x) - [f(x) - f(x-1)] = f(x+1) - 2f(x) + f(x-1)$$

# Edge Detection Using Difference Masks

# Mask $[-1, 0, 1]$ for 1<sup>st</sup> Derivative

|       |           |     |    |    |    |    |    |    |    |    |    |    |
|-------|-----------|-----|----|----|----|----|----|----|----|----|----|----|
| $S_1$ |           |     | 12 | 12 | 12 | 12 | 12 | 24 | 24 | 24 | 24 | 24 |
| $S_1$ | $\otimes$ | $M$ | 0  | 0  | 0  | 0  | 12 | 12 | 0  | 0  | 0  | 0  |

(a)  $S_1$  is an upward step edge

|       |           |     |    |    |    |    |     |     |    |    |    |    |
|-------|-----------|-----|----|----|----|----|-----|-----|----|----|----|----|
| $S_2$ |           |     | 24 | 24 | 24 | 24 | 24  | 12  | 12 | 12 | 12 | 12 |
| $S_2$ | $\otimes$ | $M$ | 0  | 0  | 0  | 0  | -12 | -12 | 0  | 0  | 0  | 0  |

(b)  $S_2$  is a downward step edge

Double responses at the transition

# Mask $[-1, 0, 1]$ for 1<sup>st</sup> Derivative

|       |           |     |    |    |    |    |    |    |    |    |    |    |

| $S_2$ | $\otimes$ | $M$ | 0  | 0  | 0  | 0  | 12 | -12 | 0  | 0  | 0  | 0  |

(b)  $S_2$  is a downward step edge

“Up-and-down” responses at edges

# Mask $[-1, 2, -1]$ for 2<sup>nd</sup> Derivative

|       |           |     |    |    |    |    |    |    |    |    |    |    |
|-------|-----------|-----|----|----|----|----|----|----|----|----|----|----|
| $S_3$ |           |     | 12 | 12 | 12 | 12 | 15 | 18 | 21 | 24 | 24 | 24 |
| $S_3$ | $\otimes$ | $M$ | 0  | 0  | 0  | -3 | 0  | 0  | 0  | 3  | 0  | 0  |

(c)  $S_3$  is an upward ramp

|       |           |     |    |    |    |     |    |     |    |    |    |    |
|-------|-----------|-----|----|----|----|-----|----|-----|----|----|----|----|
| $S_4$ |           |     | 12 | 12 | 12 | 12  | 24 | 12  | 12 | 12 | 12 | 12 |
| $S_4$ | $\otimes$ | $M$ | 0  | 0  | 0  | -12 | 24 | -12 | 0  | 0  | 0  | 0  |

(d)  $S_4$  is a bright impulse or “line”

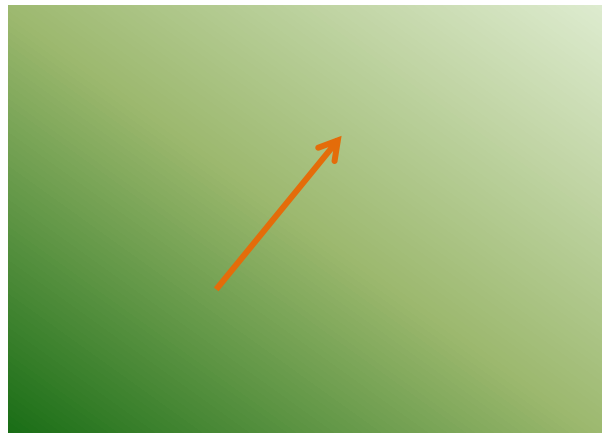

A ramp edge generates zero responses except at the starting and ending points.

# Difference Masks for 2D Images

- Gradient

$$\nabla f(x, y) = \left( \frac{\partial f}{\partial x}, \frac{\partial f}{\partial y} \right)$$

- The maximum change occurs along the direction of gradient

# Difference Masks for 2D Images

- Prewitt Masks

$$\frac{\partial f}{\partial x} \begin{bmatrix} -1 & 0 & 1 \\ -1 & 0 & 1 \\ -1 & 0 & 1 \end{bmatrix} \quad \frac{\partial f}{\partial y} \begin{bmatrix} 1 & 1 & 1 \\ 0 & 0 & 0 \\ -1 & -1 & -1 \end{bmatrix}$$

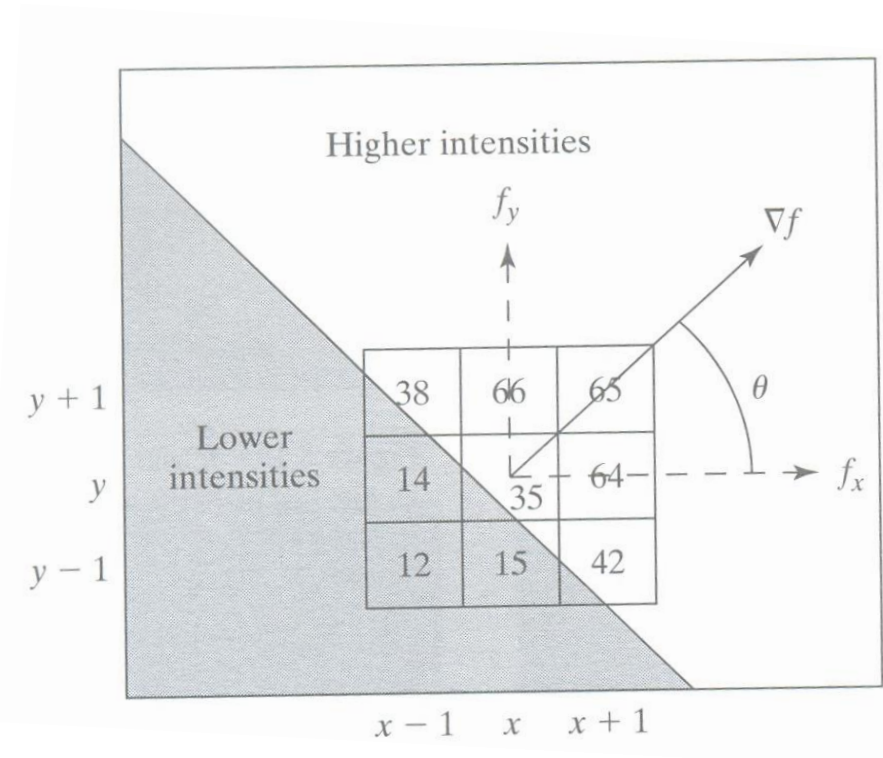

- In this example,

$$f_x = \frac{\partial f}{\partial x} = 107$$

$$f_y = \frac{\partial f}{\partial y} = 100$$

Magnitude of gradient  $|\nabla f| = 146.4$

Angle of gradient  $\theta = \tan^{-1}(100/107) = 43.1^\circ$

# Difference Masks for 2D Images

- Sobel Masks

$$\frac{\partial f}{\partial x} \begin{array}{|c|c|c|} \hline -1 & 0 & 1 \\ \hline -2 & 0 & 2 \\ \hline -1 & 0 & 1 \\ \hline \end{array}$$

$$\frac{\partial f}{\partial y} \begin{array}{|c|c|c|} \hline 1 & 2 & 1 \\ \hline 0 & 0 & 0 \\ \hline -1 & -2 & -1 \\ \hline \end{array}$$

- For computational efficiency, the magnitude of gradient is sometimes approximated by

$$\begin{aligned} |\nabla f| &= \sqrt{\left(\frac{\partial f}{\partial x}\right)^2 + \left(\frac{\partial f}{\partial y}\right)^2} \\ &\cong \left|\frac{\partial f}{\partial x}\right| + \left|\frac{\partial f}{\partial y}\right| \end{aligned}$$
